

Auto Pump-Out

First response: Being able to remove water as fast as possible is always an immediate concern when it comes to flood and water damaged sites. You need to be able to get the surfaces exposed to air and start cleaning and drying them as soon as possible. With the Auto Pump-Out from PowerPlus, you can remove a baseline amount of 1600 gallons per hour with an optional larger unit of 6000 gallons per hour for those really large disasters. As you are able to more quick to respond to flooding, mud slides, chemical spills, and the like, the better your results will be and the worry of continued exposure to contaminants will be much less.

Safe Water: The environment is important to everyone as is the need to keep contaminants out of our drinking water and soil. The Auto Pump-Out has built in filters that meet US city standards that regulate waste dumping. This means that you are getting clean water out of this system when you use it! This pump is fantastic from small to large disasters that can occur.

How does the Auto Pump-Out work?

Team it up: The auto pump-out is a great first line defense against contaminants getting back into water supplies and soil. And it is the perfect counter part to our larger D.C.U. Filters which can give you drinking water out of nuclear contaminated water. Pairing the two will extend the longevity of your D.C.U. Filters as a pre-filter.

In a word, **Explanation:** The Auto Pump-Out connects in line with your vacuum hose. The 1,600 - 6,000 gallon per hour pump pulls waste water through the stainless steel filter and pushes it out the filtered water output valve. The Auto-Pump disposes almost all of the waste water before it enters the waste tank enabling you to work all day without stopping to drain your tank.
